

A new side appears in the leftover strip

Example: $a = 8$, $b = 30$, $k = 4$. Dashed lines mark the original rectangles.

LENGTH

$$2 = 4 \cdot 8 - 30$$

$$bc = kab - b^2 = a^2 - k$$

$$60 = 960 - 900 = 64 - 4$$

a^2

64

The a -square has area $bc + k$.

Area identity; no dissection is assumed.

All shapes use the same length scale. Amber marks the $b \times c$ remainder.
