

Keep the new side; pair it with the old smaller side

First jump: $(a, b) = (30, 112)$ becomes $(c, a) = (8, 30)$, with $k = 4$.

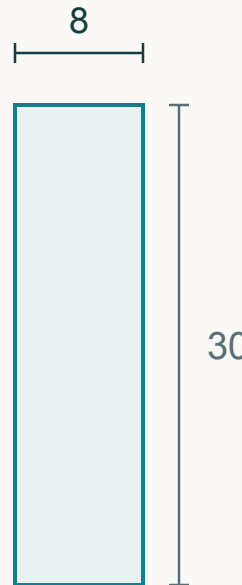

1. FIND c IN THE STRIP

$$c = 4a - b$$

use (c, a)

2. FORM THE NEXT PAIR

$(8, 30)$

Same quotient:

$$8^2 + 30^2 = 964$$

$$8 \cdot 30 + 1 = 241$$

$$964 / 241 = 4$$

The new larger side is $30 < 112$.

Remainder: $112 \cdot 8 = 30^2 - 4$.

Panels use different scales; all side ratios are exact.
