

At the boundary, the leftover width vanishes

Terminal jump: $(a, b) = (2, 8)$ becomes $(0, 2)$. Here $ka = b$, so $c = 0$.

four rectangles fill one square

NO REMAINDER

$$bc = a^2 - k = 0$$

$$\text{Therefore } k = a^2.$$

The quotient is an integer square.

4 unit squares

$$k = 4 = 2^2$$

A horizontal line segment with tick marks at both ends is labeled $a = 2$ below it.

Both squares use the same length scale. The terminal pair $(0, 2)$ is an auxiliary boundary case.
